

ZEROSON

CREATE SOFTWARE FOR ANY PLATFORM – WITHOUT CODING

What is Zeroson?

Our product, ZeroCode, is a software creation tool that lets you create software without actually having to program. It is based on a set of editing views, which in unison cover all the building blocks of a complete piece of software, from user interface to data structures.

Though ZeroCode is focused on software that are built on a database and have web user interfaces, and more specifically business software, it is very flexible. ZeroCode is more than just a tool or a platform, it is a philosophy.

Why do I need it?

With ZeroCode, you no longer need to know how to program in order to create software, nor do you need to hire a team of programmers to do it instead.

You can use ZeroCode to improve your company's existing ERP system by creating it a new user interface, or by adding entirely new modules into it. You could even make an entirely new ERP system, just like we have done with our own tool.

When or how can I get started?

ZeroCode is nearly finished as is. The engine is already humming underneath the surface, but the visual editing interfaces are still being worked on. All the functionality is already there and we have used our own tool to build an ERP system of our own.
